

## 10.3. Software Safety Configuration

#### Description

This section covers how to access the robot safety settings. It is made up of items that help you set up the robot Safety Configuration.

#### **WARNING**

Before you configure your robot safety settings, your integrator must conduct a risk assessment to guarantee the safety of personnel and equipment around the robot. A risk assessment is an evaluation of all work procedures throughout the robot lifetime, conducted in order to apply correct safety configuration settings. You must set the following in accordance with the integrator's risk assessment.

- The integrator must prevent unauthorized persons from changing the safety configuration e.g. installing password protection.
- 2. Use and configuration of the safety-related functions and interfaces for a specific robot application.
- 3. Safety configuration settings for set-up and teaching before the robot arm is powered on for the first time.
- 4. All safety configuration settings accessible on this screen and sub-tabs.
- The integrator must ensure that all changes to the safety configuration settings comply with the risk assessment.
   See Hardware Installation Manual.

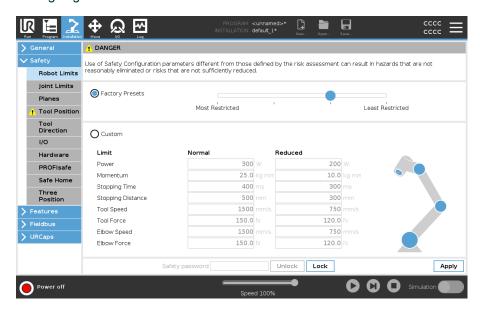

UNIVERSAL ROBOTS 10. First Time Use

Accessing Software Safety Settings Safety Settings are password protected and can only be configured once a password is set and subsequently used.

#### To access the software safety settings

- 1. In your PolyScope header, tap the **Installation** icon.
- 2. In the Side Menu on the left of the screen, tap Safety.
- 3. Observe that the Robot Limits screen displays, but settings are inaccessible.
- If a Safety password was previously set, enter the password and press Unlock to make settings accessible. Note: Once Safety settings are unlocked, all settings are now active.
- 5. Press **Lock** tab or navigate away from the Safety menu to lock all Safety item settings again.

## 10.3.1. Setting a Software Safety Password

#### Description

You must set a password to Unlock all safety settings that make up your Safety Configuration. If no safety password is applied, you are prompted to set it up.

#### To set a Software Safety password

You can tap the **Lock** tab to lock all Safety settings again or simply navigate to a screen outside of the Safety menu.

- 1. In your PolyScope header right corner, press the **Hamburger** menu and select **Settings**.
- 2. On the left of the screen, in the blue menu, press Password and select Safety.
- 3. In New password, type a password.
- 4. Now, in **Confirm new password**, type the same password and press **Apply**.
- 5. In the bottom left of the blue menu, press **Exit** to return to previous screen.

## 10.3.2. Changing the Software Safety Configuration

#### Description

Changes to the Safety Configuration settings must comply with the risk assessment conducted by the integrator.

## Recommended procedure for the integrator:

To change the safety configuration

- 1. Verify that changes comply with the risk assessment conducted by the integrator.
- 2. Adjust safety settings to the appropriate level defined by the risk assessment conducted by the integrator.
- 3. Verify that the settings are applied.
- 4. Place following text in the operators' manuals:

Before working near the robot, make sure that the safety configuration is as expected. This can be verified e.g. by inspecting the Safety Checksum in the top right corner of PolyScope for any changes. (See Safety Checksum).

## 10.3.3. Applying a New Software Safety Configuration

#### Description

The robot is powered off while you make changes to the configuration.

Your changes only take effect after you tap the Apply button.

The robot cannot be powered on again until you select **Apply and Restart** to visually inspect your robot Safety Configuration which, for safety reasons, is displayed in SI Units in a popup.

You can select **Revert Changes** to return to the previous configuration. When your visual inspection is complete you can select **Confirm Safety Configuration** and the changes are automatically saved as part of the current robot installation.

### Safety Checksum

#### Description

The Safety Checksum icon displays your applied robot safety configuration.

It could be four or eight digits.

A four-digit Checksum should be read from top to bottom and left to right, while an eight-digit Checksum is read left to right, top row first. Different text and/or colors indicate changes to the applied safety configuration.

The **Safety Checksum** changes if you change the **Safety Functions** settings, because the **Safety Checksum** is only generated by the safety settings.

You must apply your changes to the **Safety Configuration** for the **Safety Checksum** to reflect your changes.

## 10.3.4. Safety Configuration without Teach Pendant

#### Description

You can use the robot without attaching the Teach Pendant. Removing the Teach Pendant requires defining another Emergency Stop source. You must specify if the Teach Pendant is attached to avoid triggering a safety violation.

#### **CAUTION**

If the Teach Pendant is detached or disconnected from the robot, the Emergency Stop button is no longer active. You must remove the Teach Pendant from the vicinity of the robot.

# To safely remove the Teach Pendant

The robot can be used without PolyScope as the programming interface.  $\label{eq:polyscope}$ 

To configure the robot without a Teach Pendant

- 1. In the Header tap Installation.
- 2. In the Side Menu on left tap Safety and select Hardware.
- 3. Input Safety password and Unlock the screen.
- 4. Deselect **Teach Pendant** to use robot without PolyScope interface.
- 5. Press Save and restart to implement changes.

## 10.3.5. Software Safety Modes

#### Description

Under normal conditions, i.e. when no robot stop is in effect, the safety system operates in a Safety Mode associated with a set of safety limits <sup>1</sup>:

- · Normal mode is the safety mode that is active by default
- Reduced mode is active when the robot Tool Center Point (TCP) is positioned beyond a Trigger Reduced mode plane (see Software Safety Restrictions), or when triggered using a configurable input.
- Recovery mode activates when a safety limit from the active limit set is violated, the robot arm performs a Stop Category 0. If an active safety limit, such as a joint position limit or a safety boundary, is violated already when the robot arm is powered on, it starts up in Recovery mode. This makes it possible to move the robot arm back within the safety limits. While in Recovery mode, the movement of the robot arm is restricted by a fixed limit that you cannot customize.

#### **WARNING**

Limits for **joint position**, **tool position** and **tool orientation** are disabled in Recovery mode, so take caution when moving the robot arm back within the limits.

The menu of the Safety Configuration screen enables the user to define separate sets of safety limits for Normal and Reduced mode. For the tool and joints, Reduced mode limits for speed and momentum are required to be more restrictive than their Normal mode counterparts.

## 10.3.6. Software Safety Limits

#### Description

In the Safety Configuration the safety system limits are specified. The *Safety System* receives the values from the input fields and detects any violation if any these values are exceeded. The robot controller attempts to prevent any violations by making a robot stop or by reducing the speed.

#### **Robot Limits**

#### Description

Robot Limits restrict general robot movements. The Robot Limits screen has two configuration options: **Factory Presets** and **Custom**.

<sup>&</sup>lt;sup>1</sup>Robot stop was previously known as "Protective Stop" for Universal Robots robots.

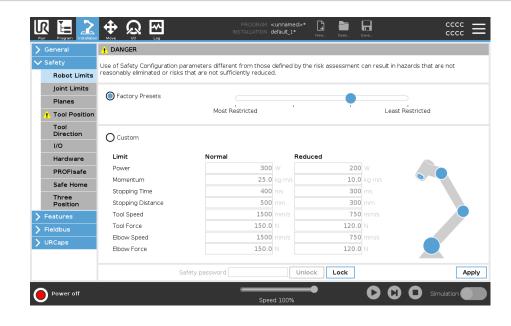

#### Factory Presets

Factory Presets is where you can use the slider to select a predefined safety setting . The values in the table are updated to reflect the preset values ranging from **Most Restricted** to **Least Restricted** 

#### **NOTICE**

Slider values are only suggestions and do not substitute a proper risk assessment.

#### Custom

Custom is where you can set Limits on how the robot functions and monitor the associated Tolerance.

	Limits maximum mechanical work produced by the robot in the
Power	environment. This limit considers the payload a part of the robot and
1 OWCI	not of the environment.
Momentum	Limits maximum robot momentum.
Stopping	Limits maximum time it takes the robot to stop e.g. when an
Time	emergency stop is activated.
Stopping Distance	Limits maximum distance the robot tool or elbow can travel while stopping.
	NOTICE  Restricting stopping time and distance affect overall robot speed. For example, if stopping time is set to 300 ms, the maximum robot speed is limited allowing the robot to stop within 300 ms.
Tool Speed	Limits maximum robot tool speed.
Tool Force	Limits maximum force that the robot tool exerts on the environment to
	prevent clamping situations.
Elbow Speed	Limits maximum robot elbow speed.
Elbow Force	Limits maximum force that the elbow exerts on the environment to
	prevent clamping situations.

Apply

Use of Safety Configuration parameters different from those defined by the risk assessment can result in hazards that are not reasonably eliminated or risks that are not sufficiently reduced. Robot Limits Joint Limits O Factory Presets Planes Tool Position Tool Direction O Custom 1/0 Limit Normal Hardware 300 W 200 W PROFIsafe 25.0 kg m/s **10.0** kg m/s Momentum Safe Home 300 ms Stopping Time 400 ms Stopping Distance 500 mm 300 mm Tool Speed 1500 mm/s **750** mm/s Tool Force **150.0** N **120.0** N **750** mm/s 1500 mm/s Elbow Speed

The tool speed and force are limited at the tool flange and the center of the two user-defined tool positions, (see Tool Position Restriction).

#### **NOTICE**

Elbow Force

You can switch back to **Factory Presets** for all robot limits to reset to their default settings.

150.0 N

120.0 N

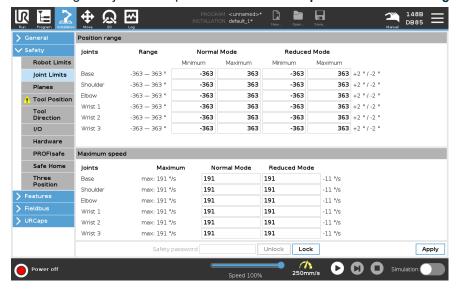

0

Unlock Lock

#### **Joint Limits**

#### Description

Joint limits allow you to restrict individual robot joint movements in joint space i.e. joint rotational position and joint rotational speed. Joint limiting can also be called software based axis limiting. The joint limit options are: **Maximum speed** and **Position range**.

#### 10.3.7. Safe Home Position

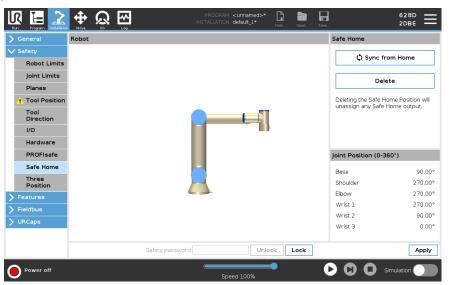

#### Description

Safe Home is a return position defined by using the user-defined Home Position.

Safe Home I/Os are active when the Robot Arm is in the Safe Home Position and a Safe Home I/O is defined.

The Robot Arm is in the Safe Home Position if the joint positions are at the specified joint angles or a multiple of 360 degrees thereof.

The Safe Home Safety Output is active when the robot is standing still at the Safe Home Position.

## Syncing from Home

#### To sync from Home

- 1. In the Header, tap Installation.
- 2. In the Side Menu on the left of the screen, tap **Safety** and select **Safe Home**.
- 3. Under Safe Home, tap Sync from Home.
- 4. Tap **Apply** and in the dialog box that appears, select **Apply and restart**.

#### Safe Home Output

The Safe Home Position must be defined before the Safe Home Output (see I/O).

#### Defining Safe Home Output

To define Safe Home Output

- 1. In the Header, tap Installation.
- 2. In the Side Menu on the left of the screen, under Safety, select I/O.
- 3. On the I/O screen in the Output Signal, under Function Assignment, in drop-down menu, select **Safe Home**.
- 4. Tap Apply and in the dialog box that appears, select Apply and restart.

## Editing Safe Home

To edit Safe Home

Editing Home does not automatically modify a previously defined Safe Home position. While these values are out of sync, Home program node is undefined.

- 1. In the Header, tap Installation.
- 2. In the Side Menu on the left of the screen, under General, select Home.
- 3. Tap Edit Position and set the new robot arm position and tap OK.
- 4. In the Side Menu, under **Safety**, select **Safe Home**. You need a Safety password to **Unlock** the Safety Settings (See Setting a Software Safety Password).
- 5. Under Safe Home, tap Sync from Home
